

## PRIORITIZATION

# 22. Getting prioritization assistance

I'm building a **CRM for real estate agents**. I have the following **4** features. How would you prioritize them based on **weighted-value models**?

1. **Feature:** Add a new filter to allow agents to search by property code.
2. **Feature:** Add a new report that shows inquiries by geography.
3. **Defect:** The option to sort properties by price isn't working.
4. **Enhancement:** Capture age of property on the property listing form flow.
